

OUR HEALTHCARE SYSTEM FAILS CHILDREN WITH CANCER.
We're on a mission to fix it.

THE PROBLEM

The current approach to childhood cancer research isn't delivering the breakthroughs needed, and its impact on children is devastating. America's healthcare system is held back by inefficiencies, inertia, and missed opportunities that slow the pace of progress toward cures.

ONLY 3 NEW DRUGS HAVE BEEN DEVELOPED
SPECIFICALLY TO TREAT CHILDHOOD CANCERS IN THE PAST 40 YEARS.

Bridge To A Cure Foundation connects the people, information, and assets needed to propel new treatments and cures for childhood cancer. This broad-view approach aims to fix the under performing healthcare system, unfettering advancements toward cures for all types of childhood cancer – rather than focusing on funding one off research projects for individual forms of the disease – *to unleash the resources our healthcare community desperately needs to save kids' lives.*

OUT OF PAIN, PURPOSE.

How One Grandfather's Journey
Powers our Mission.

Bridge To A Cure Foundation Founder/President Robert Martin knows why cancer research is failing our children. His granddaughter, Clara, was stricken with a form of brain cancer at age 4. In seeking a cure, he uncovered several serious shortfalls in America's approach to childhood cancer research and treatment.

Sadly, Clara passed away from the disease in 2017 at age six. Her courage and positive spirit inspire Bob's unique, multifaceted approach to accelerate the pace and success of cures for hundreds of thousands who suffer. In 2017, he established Bridge To A Cure Foundation to help families devastated by childhood cancer.

We're Modernizing Childhood Cancer Research, Dedicated to Healthier, Happier Kids.

Corporations deploy process improvement techniques to overcome bottlenecks that impede profits —resulting in new, better-quality products, developed faster, and at lower costs. Our Action Plan, modeled after this approach, can save thousands of children and families from the cruelty that cancer inflicts.

01.

Access A National Childhood Cancer Database

Making millions of data points readily available will propel childhood cancer cures that have eluded discovery.

The national childhood cancer database initiative needs to include everything known about cancer, the medical files of every child treated for every form of cancer, the science for every treatment, drug and alternative medicine, and more. The methods and tools for researchers and oncologists to extract meaningful findings must be made available to all, and algorithms to analyze, discover, and predict from the data must be running in real-time.

02.

Design A Clinical Trial Process Specifically for Children

We must ensure that new treatments developed are safe and effective for children.

The clinical trial process is designed for adults — not children. Children's bodies' react differently to cancer treatments, and there isn't adequate control trial data to support safe and effective dosing for kids. We must develop a protocol tailored to children that is sensitive to quality of life — taking into account the horrific agony of young patients and devastating emotional and financial impact on their families.

03.

Implement A New Approach To Childhood Cancer Research Funding

Research funding is typically determined by the "biggest bang for the buck," but investing in childhood cancer cures is a moral obligation.

The U.S. needs a national healthcare strategy that is sensitive, pragmatic, and sustainable. We must expand criteria for valuing pharmaceutical companies to reflect their contribution to curing childhood cancer. The National Cancer Institute (NCI) should deploy funds to where the money is not — childhood cancer research.
